How to Build a 24/7 AI Trader with Fable 5

A monitoring workflow: Scan → Signals → Trade Plan → Risk Check → Monitor → Final Decision.
Created by @seb.ai
🛑 **Read first.** Educational only — not financial advice, and no promise of profit. This does NOT place trades. Fable 5 has no verified live-broker connection; you supply the data and it helps you think. "24/7" means a repeatable loop you run — it only truly runs around the clock if YOU set up the automation + hosting for it. Live trading stays off, and a human must approve every decision. Trading carries real risk of loss. Paper-trade first.

---

1. What the system does

It's a repeatable routine, not an autonomous bot. Fable 5 helps you monitor market info, spot possible setups, build a structured trade plan, check the risk, and produce a clear decision memo — while you verify everything and make the final call.

```
MARKET DATA ↓ SCAN ↓ SIGNALS ↓ TRADE PLAN ↓ RISK CHECK ↓ MONITOR ↓ FINAL DECISION ↓ HUMAN REVIEW
```

2. Tools needed

Tool	Purpose	Required?
Claude Code	Where you run the workflow	Required
Fable 5	The reasoning engine	Required
Market data source	Prices, volume, levels	Required
TradingView (or other charts)	Read charts + set alerts	Recommended
Spreadsheet / database	Track setups + results	Recommended
Paper-trading account	Simulate with fake money	Required
Automation + hosting	Only if you want true 24/7	Optional

Add your own verified links: market data [add link] · charts [add link]

3. Simple setup instructions

1. Open Claude Code in a new project folder.
2. Make simple folders: data (market info), setups (trade plans), logs (results).
3. Pick your markets + timeframe (e.g. a small watchlist on the 1-hour chart).
4. Paste your verified market data, then run the stage prompts below in order.
5. Keep it on paper. Log every decision. You approve — the AI never trades.

4. Copy-and-paste prompts

① Market Scanner

> Review the data I provide for my watchlist [paste price, volume, trend, key levels, and any news]. For each asset, summarize: current trend, notable volume, and whether anything looks worth watching. Use ONLY my data — don't invent prices or news. Flag anything missing.

② Signal Detection

> From the scanned data, identify POSSIBLE setups — breakouts, pullbacks, momentum, trend continuation, or reversals. For each, state the evidence and what would confirm or invalidate it. Be clear these are possible setups, NOT guaranteed trades.

③ Trade Plan

> For [asset], turn this setup into a clear plan: direction, entry condition, target, stop-loss, invalidation level, timeframe, and risk-to-reward ratio — plus a one-line reason for the setup. Keep it specific and testable. Paper-trading plan only.

④ Risk Manager

> Account size [$X], max [1%] risk per trade. For entry [X] and stop [Y], calculate exact position size and dollar risk. Check total exposure, current open positions, volatility, and my max drawdown limit. Flag anything that breaks my rules and BLOCK the plan if it does.

⑤ Monitoring

> Here's my current watchlist + active paper setups [paste updated data]. Re-scan, tell me what changed, whether any setup triggered or invalidated, and whether risk still looks OK. Suggest watchlist updates and what alerts I should set. No predictions.

⑥ Final Decision

> Summarize the setup, signal strength, risk level, and the trade plan. Give a final status: APPROVED / WATCHLIST / REJECTED — with your reasoning. State clearly this is paper-only and requires human review. The decision and risk are mine.

5. Market Scanner

This stage reviews your watchlist across: **price action**, **volume**, **trend**, **news**, and your

watchlist assets — and surfaces what's worth a closer look. Nothing here is a trade yet; it's just noticing.

6. Signal Detection

It scans for common setups: **breakouts, pullbacks, momentum, trend continuation, reversals.**

> **Important:** these are POSSIBLE setups, not guaranteed trades. A signal is a reason to look closer — not a reason to act.

7. Trade Plan (template)

```
ASSET: DIRECTION: ENTRY: TARGET: STOP: INVALIDATION: TIMEFRAME: RISK-TO-REWARD: REASON FOR THE SETUP:
```

8. Risk Check

Before any plan is "approved," check: **position size**, **total exposure**, **maximum loss**, **drawdown limits**, **volatility**, and **existing open positions**. If any limit is breached, the plan is blocked.

9. Monitoring Loop

The system can repeat, on whatever schedule you run it: **scan → review signals → check risk → monitor active setups → update the watchlist → send alerts.**

> **About "24/7":** the loop only runs around the clock if YOU set up the automation + hosting to run it. Manually, it runs whenever you run it. Don't assume it's watching while you sleep unless you built that.

10. Final Decision Memo (template)

```
SETUP SUMMARY: SIGNAL STRENGTH: RISK LEVEL: TRADE PLAN: FINAL STATUS: APPROVED / WATCHLIST / REJECTED >> HUMAN REVIEW REQUIRED <<
```

11. Safety & limitations

☐ Start with paper trading
☐ Backtest before any live use
☐ Never expose API keys (keep them in a gitignored .env)
☐ Use strict loss limits
☐ AI can make mistakes — verify everything
☐ Past performance does not guarantee future results
☐ Educational information, not financial advice

☐ No trade executed without human review

12. Final checklist

☐ Watchlist + timeframe chosen
☐ Verified market data added
☐ All 6 stage prompts run in order
☐ Trade plan complete (entry/target/stop/invalidation)
☐ Position size + max loss checked
☐ Monitoring schedule decided
☐ Decision memo produced (APPROVED / WATCHLIST / REJECTED)
☐ Live trading disabled
☐ API keys protected
☐ You reviewed + approved — the AI did not act
